Abstract

The **AI Resume Screening & Job Recommendation** system is an intelligent recruitment application designed to make the hiring process **faster, more efficient, and user-friendly**. Traditional recruitment processes often require recruiters to manually review a large number of resumes, compare candidate qualifications, and identify suitable job opportunities. This project provides an automated approach for analyzing resumes and matching candidates with relevant job roles.

The system allows users to upload resumes in digital formats and automatically extracts important information such as **education, technical skills, certifications, experience, and projects**. Natural Language Processing (NLP) and Machine Learning techniques are used to process resume content, identify relevant skills, and calculate the similarity between candidate profiles and job descriptions. The system can rank candidates based on their suitability for a particular position and recommend job opportunities that match their skills and qualifications.

The application can be developed using **Python** for resume parsing, NLP, and machine learning, along with suitable libraries for text processing and feature extraction. A web framework such as Flask or FastAPI can be used for backend services, while **MySQL** can be used for database management. The system can also use **GitHub** for version control and **Postman** for API testing and development.

The main objective of the system is to provide an **accurate, efficient, and intelligent recruitment solution**. By combining AI, NLP, resume analysis, and job recommendation techniques, the system can reduce manual screening effort, improve candidate-job matching, and help recruiters make faster decisions while enabling job seekers to discover relevant employment opportunities.
